I have a page with javascript variables used for the creation of events. When I reload the page, the javascript variables are recreated and everything has to be recreated again. I guess that the browser reloads the html and js files whenever I click on the reload button but why? And, how do I prevent this from happening? A: As @JamesT suggested I handled this problem using the sessionStorage, I will now try the localStorage. I initialized all the variables within the function update() and then I set them to be available when the page loads, for example:

```
function update(){ ... var c1 = parseInt($("#co1").val(), 10); var c2 = parseInt($("#co2").val(), 10); var c3 = parseInt($("#co3").val(), 10); ...
```

Highly stereoselective intramolecular transamidation of arylimines with homoallylic alcohols to form functionalized tetrahydropyrans and oxetanes in good to excellent yields is demonstrated. These reactions proceed through an imine intermediate that can be deprotonated to provide the imine or converted to an amination-type iminium ion. These results demonstrate that the mechanism of the novel reactions is different from the Staudinger reaction but similar to the ring-opening reaction of epoxide/alkene cyclic sulfamidates.

1. Field of the Invention The invention relates to cleaning and preventing the build-up of gray and black mold build-up on concrete.
2. Description of the Prior Art Concrete is a difficult substance to clean and purify. Even though concrete has many beneficial characteristics, some foul-smelling graying and blackening develops on the surface of the concrete over a period of time. Concrete does not readily absorb water, and, therefore, will dry out slowly when exposed to air. This drying out is significant as the concrete shrinks and cracks and can allow moisture to come into contact with surfaces susceptible to moisture. Grey and

black mold build-up commonly occurs when concrete is exposed to moisture for extended periods of time. Moisture is present when concrete dries and the concrete can permit water to enter cracks. When water enters the cracks, moisture is available for mold and bacteria to grow and spread. The mold can be in the form of algae, mildew, moss, fungi and black mold. Once a mold has grown, the mold and bacteria can damage the surface of concrete. This mold and bacteria can cause the gray and black mold build-up on concrete to spread and ruin the concrete and the surfaces adjacent to the concrete. Various methods have been used to remove these gray and black mold build-up on the surface of concrete. Prior art methods include the use of chemicals, abrasives and water, steam, heated water
